

EERO GALLANO

gallanoe.github.io | 949-664-0912 | gallanoeero@gmail.com

EDUCATION

UC BERKELEY
BACHELOR'S IN COMPUTER SCIENCE
August 2018 - Dec 2020
GPA: 3.76 / 4.0

LINKS

github.com/gallanoe
linkedin.com/in/eerogallano

COURSEWORK

SWE

Operating Systems
Database Systems
Programming Languages and Compilers
Parallel Programming
Software Engineering
Algorithms
Data Structures
Machine Structures

AI/ML

Artificial Intelligence
Machine Learning
Deep Neural Networks
Natural Language Processing
Probability and Random Processes
Convex Optimization
Theoretical Statistics (Graduate)
Game Theory

SKILLS

FULL-STACK DEVELOPMENT

Java, Typescript, React, Redux, AWS (Lambda, DynamoDB, S3, SNS/SQS, etc.)

DATA & ML

Python, NumPy, Pandas, Scikit-learn, PyTorch

DEVOPS

CI/CD, Agile/Scrum, Git

EXPERIENCE

SOFTWARE DEVELOPMENT ENGINEER AMAZON | JUNE 2021 - PRESENT

Building and maintaining secure multi-tenant communications systems and developing AI-driven tools that empower Amazon analysts in finance operations (AR/AP for AWS and Amazon Business).

- Drove AWS security certification for multiple features, ensuring compliance with enterprise standards.
- Designed and led implementation of a GDPR-compliant data deletion system across microservices, improving regulatory adherence.
- Led design and build of a multitenant AuthN/Z system with asymmetric cryptography and JWTs, reducing dependencies and improving service decoupling.
- Built a centralized configuration service supporting 1K TPS at <10ms latency, enabling high-performance scaling.
- Developed and executed load testing for 25+ APIs across 5 microservices, validating scalability for an AWS program launch.
- Modernized UI with a scalable short polling mechanism for near-real-time notifications.
- Migrated millions of customer communications across hundreds of thousands of AR accounts in global AWS markets to a secure platform.
- Building a conversational agent for Amazon Finance, enabling automated query processing and contextual document retrieval across enterprise-scale data.

RESEARCH PROJECTS

SIGNAL PROCESSING METHODS FOR NOISE-RESISTANT CNNs DEEP NEURAL NETWORKS | 2020

Worked in a group of three to design and test image preprocessing methods to protect state-of-the-art mobile architectures against noisy and adversarial inputs. Used Python and PyTorch to load and test method designs.

USING INTERACTIVE PARTICLE SYSTEMS TO MODEL SPREAD OF MISINFORMATION PROBABILITY AND RANDOM PROCESSES | 2019

Worked in a group of three to model the spread of misinformation using interactive particle systems and ran simulations of the model to test hypothesis concerning containment of misinformation. Used Python with SimPy and NetworkX libraries.
